$$CO2p_{v,mp} = CO2p(RP)_{v,mp} \cdot (\sum_r s_{r,sg} \cdot CO2p_{r,mp}) / (\sum_r s_{r,sg} \cdot CO2p(RP)_{r,mp})$$

Where

\sum_r is the sum over all representative vehicles r for the sub-group sg ;

2. APPLICATION OF THE ADJUSTED REFERENCE CO₂ EMISSIONS ACCORDING TO ARTICLE 11(2)

If in the reporting period of the year Y the specific CO₂ emissions of some new heavy-duty vehicles of a manufacturer have been determined with amendments referred to in Article 11(2), the reference CO₂ emissions rCO_{2sg} of the vehicle sub-group sg used in points 4 and 5.1 of Annex I shall be calculated as follows:

- for $i \geq 1$: the reference CO₂ emissions that have been determined for the vehicle sub-group sg with the amendment i .

ANNEX III

Normalisation of specific CO₂ emissions of new heavy-duty vehicles referred to in Article 4

1. NORMALISATION OF SPECIFIC CO₂ EMISSIONS

For the purposes of the calculation in point 2.1 of Annex I, the values of CO₂ emissions $CO_{2,v,mp}$ of vehicles are normalised as follow:

$$CO_{2,v,mp} = reportCO_{2,v,mp} + \Delta CO_{2,v,mp}(m) + \Delta CO_{2cv,v,mp}$$

$$m = PL_{sg,mp} - PL_{v,mp} + cCW_v \quad (\text{for vehicles of categories N and O})$$

$$m = PM_{sg,mp} - PM_{v,mp} + cCW_v \quad (\text{for vehicles of category M})$$

Where

$CO_{2,v,mp}$ are the normalised CO₂ emissions of the vehicle v determined for a mission profile mp that are to be considered in the calculation of Annex I point 2.1;

$reportCO_{2,v,mp}$ are the CO₂ emissions in g/km of the primary vehicle of a new heavy-duty vehicle v determined for a mission profile mp and reported in accordance with Articles 13a and 13b;

$\Delta CO_{2,v,mp}(m)$ is to be determined in accordance with point 3;

$\Delta CO_{2cv,v,mp}$ is to be determined in accordance with point 4;

$PL_{v,mp}$ is the payload of vehicle v in the mission profile mp , as determined from the data reported according to Articles 13a and 13b ;

$PL_{sg,mp}$ is the payload for sub-group sg and mission profile mp as provided for in point 2.5 of Annex I;

$PM_{v,mp}$ is the passenger mass of vehicle v in the mission profile mp , as determined from the data reported according to Articles 13a and 13b;

$PM_{sg,mp}$ is the passenger mass for sub-group sg and mission profile mp as provided for in point 2.5 of Annex I;

cCW_v is the correction of the curb weight of the vehicle v according to point 2.

2. CURB WEIGHT NORMALISATION

Since the transport utility of a vehicle increases with its technically permissible maximum payload or passenger number, but for technical reasons higher values for these parameters are correlated with higher curb weights and therefore higher CO₂ emissions, the following correction of the curb weight of a vehicle v in sub-group sg for the purpose of the normalisation of its specific CO₂ emissions according to point 1 shall be applied:

$$cCW_v = a_{sg} \cdot (maxPL_{sg} - maxPL_v) \quad \text{for vehicles of category N and O;}$$

$$cCW_v = a_{sg} \cdot (maxPN_{sg} - maxPN_v) \quad \text{for vehicles of category M;}$$

Where

- a_{sg} is a linear coefficient determined according to point 2.1 for the reporting period of the vehicle v ;
- $maxPL_v$ is the technically permissible maximum payload of vehicle v as determined from the data reported according to Articles 13a and 13b;
- $maxPN_v$ is the technically permissible maximum passenger number of vehicle v as determined from the data reported according to Articles 13a and 13b;

- $maxPN_{sg}$ is the technically permissible maximum passenger number of vehicle sub-group sg determined according to point 2.5 of Annex I.

2.1. Determination of normalisation parameters

For each reporting period the parameters a_{sg} and b_{sg} shall be determined with a linear regression analysis of the correlation of the values of CW_v with the values of $maxPL_v$ (category N and O vehicles) and $maxPN_v$ (category M vehicles), considering all newly registered vehicles v in the sub-group sg :

$$CW_v \approx a_{sg} \cdot maxPL_v + b_{sg} \quad \text{for vehicles of category N and O;}$$

$$CW_v \approx a_{sg} \cdot maxPN_v + b_{sg} \quad \text{for vehicles of category M.}$$

Where

- CW_v is the curb weight of vehicle v , as determined from the data reported according to Articles 13a and 13b; if no precise value is available it may be approximated by the corrected actual mass of the vehicle v
- $maxPL_v$ is the technically permissible maximum payload of vehicle v as determined from the data reported according to Articles 13a and 13b;
- $maxPN_v$ is the technically permissible maximum passenger number of vehicle v as determined from the data reported according to Articles 13a and 13b;.

3. CHANGE OF CO₂ EMISSIONS FOR CHANGE IN TOTAL VEHICLE MASS

The ex-post change of CO₂ emissions of a vehicle v to be determined for a mission profile mp due to an ex-post change in the total mass to be attributed to the vehicle for the determination of CO₂ emissions is defined by the following linear approximation:

$$\Delta CO2_{v,mp}(m) = m \cdot (CO2_{v,r} - CO2_{v,l}) / (Mr - Ml)$$

Where:

m	is the change of total mass attributed to the vehicle v for the determination of its CO ₂ emissions;
$CO2_{v,r}$	are the CO ₂ emissions of the vehicle v in g/km, without the change of mass, determined for the same mission profile mp , representative loading conditions;
$CO2_{v,l}$	are the CO ₂ emissions of the vehicle v in g/km, without the change of mass, determined for the same mission profile mp , low loading conditions;
Mr	is the total vehicle mass in simulation, without the change of mass, for the same mission profile mp , representative loading conditions;
MI	is the total vehicle mass in simulation, without the change of mass, for the same mission profile mp , low loading conditions.

4. NORMALISATION FOR DIFFERENT CARGO VOLUMES

Category O vehicles within the same sub-group have different cargo volumes. Since the transport utility of a vehicle increases with the cargo volume, but for technical reasons such increase is also correlated with higher CO₂ emissions, the following correction of the CO₂ emissions of a vehicle v in sub-group sg shall be applied:

$$\Delta CO2_{cv_{v,mp}} = a_{sg,mp} \cdot (CV_{sg} - CV_v)$$

Where

$a_{sg,mp}$	is a linear coefficient determined according to point 4.1 for the reporting period of the vehicle v ;
CV_v	is the cargo volume of vehicle v as determined from the data reported according to Articles 13a and 13b;
CV_{sg}	is the cargo volume of vehicle sub-group sg determined according to point 2.5 of Annex I.

For vehicle of categories N and M the correction of CO₂ emissions $\Delta CO2_{cv_{v,mp}}$ shall be 0.

4.1. Determination of normalisation parameters

For each reporting period and mission profile the parameters $a_{sg,mp}$ and $b_{sg,mp}$ shall be determined with a linear regression analysis of the correlation of the values of $[reportCO2_{v,mp} + \Delta CO2_{v,mp}(m)]$ with the values of CV_v , considering all newly registered vehicles v in the sub-group sg :

$$reportCO2_{v,mp} + \Delta CO2_{v,mp}(m) \approx a_{sg,mp} \cdot CV_v + b_{sg,mp}$$

Where

CV_v	is the cargo volume of vehicle v as determined from the data reported according to Articles 13a and 13b;
--------	--

reportCO2_{v,mp} , $\Delta CO2_{v,mp}(m)$ are as defined in point 1.'
